(a) Clocks from equilibrium geometry
coarse
fine | coarse
Bethe N=16 (open: failed gate)
Bethe N=32
Bethe N=64
two-state null (N=16,32,64)
product null (N=16,32,64)
predicted $\gamma^{1/2}$ (centroid channel)
measured half-information $\gamma^{1/2}$ (N>16: on 21-pt grid)
(b) Information budget (exact N=16)
coarse
fine | coarse
within leaf
fraction of total information rate
γ
(c) Rate profile: contrast vs finite difference
finite difference of entropy curve
contrast (compensator) form
coarse
fine | coarse
rate RMSE / peak rate (24 paths)
γ
(d) Reference-free calibration test
symbol size ∝ true info. error
identity gap $\max_\gamma |\Delta_q|$ / path s.e.
exact filter (all seeds)
mis-specification (β'/β_J: black; field scale λ: orange)
